

Thm 5.16  $P \subseteq NP \subseteq EXP$ .

Proof:

1.  $P \subseteq NP$

Let  $L \in P$ . We shall prove  $L \in NP$ .

Let  $p(n) = 0$ , and let  $M$  be a TM that decides  $L$  efficiently.

If  $x \in L$ , then  $M(x, \epsilon) = 1$ . If  $x \notin L$ , then  $M(x, \epsilon) = 0$ .

2.  $NP \subseteq EXP$

Let  $L \in NP$ . We will prove  $L \in EXP$ .

Since  $L \in NP$ , there exists a polynomial  $p : \mathbb{N} \rightarrow \mathbb{N}$  and a polynomial-time TM  $M$  s.t. 1,2 hold.

Construct a TM  $M'$  which enumerates all  $w \in \{0, 1\}^{p(|x|)}$  and check if  $M(x, w) = 1$ .

If there exists one  $w$  s.t.  $M(x, w) = 1$ , then  $M$  accepts  $x$ .

The total running time is  $2^{p(n)} \cdot \text{poly}(n) = 2^{n^{O(1)}} \cdot n^{O(1)} = 2^{n^{O(1)}}$

- $\text{poly}(n) = n^{O(1)}$

---

## Nondeterministic TMs

---

**At any point, the machine may proceed according to several possibilities. The transition function**

$$\delta : Q \times \Gamma \rightarrow P(Q \times \Gamma \times \{L, R, S\})$$

**Formally, an NTM**  $M = (\Sigma, \Gamma, Q, \delta, q_0, q_{\text{accept}}, q_{\text{reject}})$

**$M$  accepts  $x$  if there is a computation path that accepts  $x$ .**

---

**Def 5.17 Say an NTM  $M$  runs in time  $T(n)$  if for every input  $x \in \{0, 1\}^n$ , and every sequence of nondeterministic choice,  $M$  reaches an end state in  $T(n)$  steps.**

---

**Def 5.18 Say an NTM  $M$  decides  $L$  if for every  $x \in \{0, 1\}^*$ ,  $x \in L \Leftrightarrow M(x) = 1$**

---

*Def 5.19(Binary-choice NTM)*

$$M = (Q, \Sigma, \Gamma, \delta_1, \delta_2, q_0, q_{\text{accept}}, q_{\text{reject}}),$$

**where  $\delta_1, \delta_2 : Q \times \Gamma \rightarrow Q \times \Gamma \times \{L, R, S\}$**

**At each step,  $M$  applies  $\delta_1$  or  $\delta_2$  arbitrarily.**

---

**Lem 5.20 Let  $L \subseteq \{0, 1\}^*$ . If  $L$  can be decided by an NTM  $M$  in time  $T(n)$ , then  $L$  can be decided by a binary-choice NTM in time  $O_M(T(n))$ .**

*Proof:* At each step,  $M$  can have at most  $2^{|Q| \times |\Gamma| \times 3}$  choices. This can be simulated in  $\log_2 2^{|Q| \times |\Gamma| \times 3} = |Q| \times |\Gamma| \times 3$  steps by a binary-choice NTM.

So, the total running time is  $\leq |Q| \times |\Gamma| \times 3 \times T(n) = O_M(T(n))$ . Q.E.D.

---

**Def 5.21** Let  $T : \mathbb{N} \rightarrow \mathbb{N}$ . Let  $NTIME(T(n))$  be the set of languages that can be decided by an NTM in time  $O(T(n))$ .

---

**Thm 5.22**  $NP = \cup_{c \geq 1} NTIME(n^c)$

*Proof:*

1.  $(\cup_{c \geq 1} NTIME(n^c) \subseteq NP)$  Let  $L \in \cup_{c \geq 1} NTIME(n^c)$ , we will prove  $L \in NP$ .

Since  $L \in NTIME(n^c)$ , there exists a binary-choice NTM  $N$  that decides  $L$  in time  $d \cdot n^c$ , where  $d > 0$  is a constant. Let  $p(n) = d \cdot n^c$ , and let the certificate  $w \in \{0, 1\}^{p(n)}$  indicates which transition function to apply. The verifier checks if  $N$  accepts  $x$  (given the certificate).

2.  $(NP \subseteq \cup_{c \geq 1} NTIME(n^c))$  Let  $L \in NP$ . We will prove  $L \in \cup_{c \geq 1} NTIME(n^c)$ .

..... On input  $x$ , construct an NTM as follows:

1. Nondeterministically guess  $w \in \{0, 1\}^{p(|x|)}$
2. Simulate  $M$  on input  $(x, w)$ . Accept if and only if  $M$  accepts  $(x, w)$ .

It is clear that  $N$  runs in polynomial time, and  $N$  decides  $L$ . Q.E.D.

---

**Def 5.23(Karp Reduction)** Let  $L, K \subseteq \{0, 1\}^*$ . Say  $L$  is Karp-reducible to  $K$ , denoted by  $L \leq_P K$ , if there exists a polynomial-time TM  $M$  s.t. for all  $x \in \{0, 1\}^*$ ,  $x \in L \Leftrightarrow M(x) \in K$ .

- $L \leq_P K \Rightarrow$  If  $K \in P$ , then  $L \in P$ . If  $L \notin P$ , then  $K \notin P$ .
- 

**Lem 5.24** If  $L_1 \leq_P L_2$  and  $L_2 \leq_P L_3$ , then  $L_1 \leq_P L_3$ .

- Let  $M_3 = M_2(M_1(x))$ , which also runs in polynomial time. We can check  $x \in L_1 \Leftrightarrow M_3(x) \in L_3$ .
- 

**Def 5.25(NP-Hard)**  $L \subseteq \{0, 1\}^*$  is NP-hard if for all language  $K \in NP$ ,  $K \leq_P L$ .

---

**Def 5.26(NP-Complete)**  $L$  is NP-complete if  $L$  is in NP, and  $L$  is NP-hard.

- $NP\text{-complete} = NP \cap NP\text{-hard}$
- 

**Lem 5.27** If  $L$  is NP-hard, and  $L \in P$ , then  $P = NP$ .

---

**Lem 5.28** Let  $L \in NP\text{-complete}$ . Then  $L \in P \Leftrightarrow P = NP$ .

---

## Cook-Levin Theorem

---

- Cook(1971), Levin(1973) proved the first NP-complete problem SAT.

## SAT (Boolean Satisfiability Problem)

- Variable:  $x, y, z, \dots$  can take TRUE or FALSE.
- Literal: A variable or its negation. eg.  $x, \neg x, y, \neg y, \dots$
- Clause: OR(Disjunction) of one or more literals. eg.  $\neg x \vee y, \neg y \vee z, \dots$
- Formula: AND(Conjunction) of one or more clauses.

$$SAT = \{\langle \phi \rangle \mid \phi \text{ is satisfiable}\}$$

---

*Thm 5.29* **SAT is NP-complete.**
