## **Turing Machine**

eg. Decide  $L=\{0^{2^n}|n\geq 0\}$ , where  $\Sigma=\{0\}$ 

- Idea:
  - 1. If there is a single 0, accept
  - 2. Sweep from left to right, crossing off every other  $\boldsymbol{0}$
  - 3. If the number of 0's is odd, reject
  - 4. Return the head to the left-hand end
  - 5. Goto step 1
- $\Sigma = \{0\}, \Gamma = \{0, \sqcup, \rhd, x\}$

Def 3.2 Let  $L\subseteq\{0,1\}^*$  , let M be a TM. Say M decides L in time T(n) if for every  $x\in\{0,1\}^*$  ,

- 1. M halts in T(n) steps
- 2. If  $x \in L$ , then M accepts x
- 3. If  $x \not\in L$ , then M rejects x

Def 3.3 Let  $L\subseteq\{0,1\}^*$ . Call L (Turing) decidable if there is a TM that decides it.

- Note that, on an input x, a TM may accept, reject or loop forever.
- In *Def 3.2*, the machine should never loop forever.

 ${\it Def 3.4}$  Let M be a TM. The set of strings that M accepts is the language recognized by M, denoted by L(M).

Def 3.5 Let  $L\subseteq\{0,1\}^*$ . Call L (Turing) recognizable if there is some TM that recognizes it.

- Obviously, every (Turing) decidable language is (Turing) recognizable.
- The converse is not true. eg.  $L = \{ \langle M, x \rangle | M \ halts \ on \ x \}$

Def 3.6 Let  $f:\{0,1\}^* \to \{0,1\}^* \cup \{undefined\}$ . Say TM M computes f if for every  $x \in \{0,1\}^*$  with  $f(x) \neq undefined$ , M halts with f(x) on its tape in at most T(|x|) steps.

An algorithm is a Turing Machine.

- ——Alan Turing
- Despite its simplicity, TM is capable of implementing any computer algorithm.

## **Variants of Turing Machines**

Lem 3.7 If language  $L\subseteq\{0,1\}^*$  is decidable in time T(n) by a TM on alphabet  $\Gamma$ , then it is decidable in time  $O(\log |\Gamma|\cdot T(n))=O_\Gamma(T(n))$  by a TM on alphabet  $\Gamma=\{0,1,\sqcup,\rhd\}$ .

*Proof:* Encode any symbol in  $\Gamma$  using  $k=\lceil\log_2|\Gamma|\rceil=O(\log_2|\Gamma|)$  bits. To simulate one step of M, the new TM M' will

- 1. Use k steps to read a symbol  $a \in \Gamma$
- 2. Transit to next step q', and get the new symbol b (to overwrite a)
- 3. Overwrite a by b
- 4. Go left or right for k steps or stay

Def 3.8 A k-tape(O(1)-tape) TM M is a 7-tuple  $(Q, \Sigma, \Gamma, \delta, q_0, q_{accept}, q_{reject})$ , where

$$\delta: Q imes \Gamma^k o Q imes \Gamma^k imes \{L,R,S\}^k$$

Usually,the first tape is the *input tape*, the last tape is the *output tape*, and the rest are *work tapes*.

Lem 3.9 Let  $L\subseteq\{0,1\}^*$ . If L is decidable by a k-tape TM in time T(n), then L is decidable by a single-tape TM in time  $O(k\cdot T(n)^2)$ .
